Abstract

We deal with congruences on semilattices with section antitone involution which rise e.g., as implication reducts of Boolean algebras, MV-algebras or basic algebras and which are included among implication algebras, orthoimplication algebras etc. We characterize congruences by their kernels which coincide with semilattice filters satisfying certain natural conditions. We prove that these algebras are congruence distributive and 3-permutable.

Keywords: semilattice, section, antitone involution, congruence kernel, filter, congruence distributivity, 3-permutability.

Let \((P; \leq)\) be an ordered set. A mapping \(x \mapsto x'\) on \(P\) is called an antitone involution if \(x'' = x\) and \(x \leq y \Rightarrow y' \leq x'\).

By a semilattice with section antitone involutions (semilattice with SAI, for short) is meant a structure \(S = (S; \lor, 1, (\sigma)_{a \in S})\) such that \((S; \lor)\) is a join-semilattice with greatest element 1 and for each \(a \in S\) there exists an antitone involution \(x \mapsto x^a\) on the interval \([a, 1]\) (the so-called section, see e.g., [3]).

*This work is supported by the Research Project MSM 6198959214 by Czech Government.
Let us note that semilattices with SAI are rather frequent in algebraic investigations. If e.g., \((B; \lor, \land, \top, 0, 1)\) is a Boolean algebra and \(x^a = x \lor a\) then \((B; \lor, 1, (\cdot))_{a \in B}\) is a semilattice with SAI. Similarly, if \((L; \lor, \land, \top, 0, 1)\) is an orthomodular lattice and \(x^a = x^\perp \lor a\) then \((L; \lor, 1, (\cdot))_{a \in L}\) is a semilattice with SAI. If \(M = (M; \oplus, \neg, 0)\) is an MV-algebra and we define \(1 = \neg 0, x \lor y = \neg(\neg x \oplus y) \oplus y\) and \(x^a = \neg x \oplus a\) then \((M; \lor, 1, (\cdot))_{a \in M}\) is a semilattice with SAI. In the same way it can be shown for basic algebras (see e.g., [5]). If \((A; \cdot, 1)\) is a positive BCK-algebra then for \(x \lor y = (x \cdot y) \cdot y\) and \(x^a = x \cdot a\) we obtain a semilattice with SAI \((A; \lor, 1, (\cdot))_{a \in A}\) again, see e.g., [5]. Analogously, every implication algebra (see [1]), orthoimplication algebra (see [2]) or weak implication algebra (see [6]) can be converted into a semilattice with SAI.

The aim of this paper is to characterize congruences on semilattices with SAI via their congruence kernels and prove several important congruence identities.

Let \(S = (S; \lor, 1, (\cdot))_{a \in S}\) be a semilattice with SAI. Although \(S\) is only a partial algebra since the involutions are defined only on sections, it can be easily converted into a total algebra if one define enlarged unary operations \((\cdot))_{a \in S}\) in the way \(x \mapsto (x \lor a)^a\). Since \(x \lor a \in [a, 1]\), this is everywhere defined operation which coincides with the original one just on the section \([a, 1]\). Moreover, we can define a new binary operation \(x \cdot y = (x \lor y)^y\) which can replace other operations of \(S\) since \(x \lor y = (x \cdot y) \cdot y\) and \(x^a = x \cdot a\) for \(x \in [a, 1]\). However, in some reasonable cases, it is useful to deal with the original structure \(S\) as defined above.

Let \(S = (S; \lor, 1, (\cdot))_{a \in S}\) be a semilattice with SAI. By a congruence on \(S\) is meant an equivalence relation \(\Theta\) on \(S\) having the substitution property with respect to all operations of \(S\), i.e. if \((a, b), (c, d) \in \Theta\) then \((a \lor c, b \lor d) \in \Theta\) and for each \(z \leq a, z \leq b\) also \((a^z, b^z) \in \Theta\). Denote by \(\text{Con}S\) the lattice of all congruences on \(S\) and for \(\Theta \in \text{Con}S\) denote by \([1]_\Theta = \{x \in S; (x, 1) \in \Theta\}\), the so-called kernel of \(\Theta\).

At first we establish connection between congruences and their kernels.

**Theorem 1.** Let \(S = (S; \lor, 1, (\cdot))_{a \in S}\) be a semilattice with SAI and \(\Theta \in \text{Con}S\). Then \((x, y) \in \Theta\) if and only if \((x \lor y)^y, (x \lor y)^y \in [1]_\Theta\). If \(\Theta, \Phi \in \text{Con}S\) and \([1]_\Theta = [1]_\Phi\) then \(\Theta = \Phi\).

**Proof.** If \((x, y) \in \Theta\) then \((x \lor y)^y, 1) = (x \lor y)^y, (x \lor x)^y \in \Theta\) and \((x \lor y)^y, 1) = (x \lor y)^y, (y \lor y)^y \in \Theta\) thus \((x \lor y)^y, (x \lor y)^y \in [1]_\Theta\).
Conversely, assume \((x \lor y)^y, (x \lor y)^x \in [1]_{\Theta}\). Then \langle (x \lor y)^y, 1^y \rangle \in \Theta\) and hence
\[
\langle x \lor y, y \rangle = \langle (x \lor y)^y, 1^y \rangle \in \Theta
\]
and, analogously, \(\langle x \lor y, x \rangle \in \Theta\). Due to symmetry and transitivity of \(\Theta\), we infer \(\langle x, y \rangle \in \Theta\).

Hence, if \(\Theta, \Phi \in \text{Con}\mathcal{S}\) and \([1]_{\Theta} = [1]_{\Phi}\) then \(\langle x, y \rangle \in \Theta\) iff \((x \lor y)^x, (x \lor y)^y \in [1]_{\Theta} = [1]_{\Phi}\) iff \(\langle x, y \rangle \in \Phi\) thus \(\Theta = \Phi\).

By Theorem 1, every congruence on \(\mathcal{S}\) is uniquely determined by its kernel. Hence, to characterize congruences we need only to characterize their kernels which is our next task.

Let \(\mathcal{S} = (S; \lor, 1, (a)_{a \in S})\) be a semilattice with SAI. A subset \(F \subseteq \mathcal{S}\) is called a filter of \(\mathcal{S}\) if \(1 \in F\) and the following conditions are satisfied

(i) \(a \in F\) and \(a \leq y\) imply \(y \in F\);
(ii) \(a \in F\) and \(a^x \in F\) imply \(x \in F\);
(iii) \(a^b \in F\) implies \((a \lor z)^{(b \lor z)} \in F\) for each \(z \in \mathcal{S}\);
(iv) \(a^b \in F\) implies \((b^z)^{(a^z)} \in F\) for each \(z \leq b\).

Let us note that if \(b \leq a\) then \(b \lor z \leq a \lor z\) and if, moreover, \(z \leq b\), then \(a^z \leq b^z\) thus the conditions (iii) and (iv) are correctly settled.

In what follows, let \(\mathcal{S} = (S; \lor, 1, (a)_{a \in S})\) be a semilattice with SAI and \(F\) be a subset of \(\mathcal{S}\). Define a binary relation \(\Theta_F\) on \(\mathcal{S}\) by the rule
\[
\langle x, y \rangle \in \Theta_F \quad \text{if and only if} \quad (x \lor y)^x, (x \lor y)^y \in F.
\]

**Lemma 1.** Let \(F\) be a filter of \(\mathcal{S}\) and \(a \leq b \leq c\).

(a) If \(b^a \in F\) and \(c^b \in F\) then also \(c^a \in F\);
(b) If \(\langle a, b \rangle \in \Theta_F\) and \(\langle b, c \rangle \in \Theta_F\) then \(\langle a, c \rangle \in \Theta_F\);
(c) If \(\langle b, c \rangle \in \Theta_F\) then \(\langle b^a, c^a \rangle \in \Theta_F\);
(d) If \(\langle a, b \rangle \in \Theta_F\) and \(z \in S\) then \(\langle a \lor z, b \lor z \rangle \in \Theta_F\).
Proof.

(a) Since \( c^b \in F \) and \( a \leq b \leq c \), by (iv) we have \( (b^a)^{(c^a)} \in F \). Since also \( b^a \in F \), (ii) implies \( e^a \in F \).

(b) If \( a \leq b \leq c \) and \( \langle a, b \rangle \in \Theta_F \), \( \langle b, c \rangle \in \Theta_F \) then, by the definition of \( \Theta_F \) we have

\[
b^a = (a \lor b)^a \in F \quad \text{and} \quad c^b = (b \lor c)^b \in F.
\]

By (a) we obtain \( e^a \in F \) whence \( (a \lor c)^a = e^a \in F \), \( (a \lor c)^c = e^c = 1 \in F \) thus \( \langle a, c \rangle \in \Theta_F \).

(c) Since \( a \leq b \leq c \) we have \( c^a \leq b^a \). If \( \langle b, c \rangle \in \Theta_F \) then \( c^b = (b \lor c)^c \in F \) thus, by (iv), also \( (b^a)^{(c^a)} \in F \), i.e. \( (b^a \lor c^a)^{(c^a)} = (b^a)^{(c^a)} \in F \) and \( (b^a \lor c^a)^{(c^a)} = (c^a)^{(c^a)} = 1 \in F \) whence \( \langle b^a, c^a \rangle \in \Theta_F \).

(d) Let \( z \in S \) and \( \langle a, b \rangle \in \Theta_F \). Then \( b^a = (a \lor b)^b \in F \) and, by (iii), also

\[
\langle b \lor z \rangle^{(a \lor z)} \in F. \quad \text{Of course,} \quad a \lor z \leq b \lor z \quad \text{thus} \quad \langle (a \lor z) \lor (b \lor z) \rangle^{(a \lor z)} = \langle b \lor z \rangle^{(a \lor z)} \in F \quad \text{and} \quad \langle (a \lor z) \lor (b \lor z) \rangle^{(b \lor z)} = \langle b \lor z \rangle^{(b \lor z)} = 1 \in F \quad \text{whence} \quad \langle a \lor z, b \lor z \rangle \in \Theta_F.
\]

\[\blacksquare\]

Theorem 2. Let \( S = (S; \lor, 1, (a)_{a \in S}) \) be a semilattice with SAI. A subset \( F \subseteq S \) is a kernel of some congruence of \( S \) if and only if \( F \) is a filter of \( S \). If \( F \) is a filter of \( S \) then \( \Theta_F \) is a congruence on \( S \) and \( F = [1]_{\Theta_F} \).

Proof. Assume \( F = [1]_{\Theta} \) for some \( \Theta \in \text{Con}S \). We are going to check (i)–(iv) to prove that \( F \) is a filter of \( S \).

(i) If \( a \in [1]_{\Theta} \) and \( a \leq y \) then \( \langle a, 1 \rangle \in \Theta \) and hence \( \langle y, 1 \rangle = \langle a \lor y, 1 \lor y \rangle \in \Theta \) thus \( y \in [1]_{\Theta} \).

(ii) Let \( a \in [1]_{\Theta} \) and \( a^x \in [1]_{\Theta} \). Then \( \langle a^x, 1 \rangle \in \Theta \) thus also \( \langle a, x \rangle = \langle a^{x \lor 1}, 1^x \rangle \in \Theta \). Due to the fact that \( \langle a, 1 \rangle \in \Theta \), we conclude \( \langle x, 1 \rangle \in \Theta \) whence \( x \in [1]_{\Theta} \).

(iii) Assume \( a^b \in [1]_{\Theta} \), i.e. \( \langle a^b, 1 \rangle \in \Theta \). Then \( \langle a, b \rangle = \langle a^b, 1^b \rangle \in \Theta \) thus also \( \langle a \lor z, b \lor z \rangle \in \Theta \) for each \( z \in S \). Hence

\[
\langle (a \lor z)^{(b \lor z)}, 1 \rangle = \langle (a \lor z)^{(b \lor z)}, (b \lor z)^{(b \lor z)} \rangle \in \Theta
\]

thus \( (a \lor z)^{(b \lor z)} \in [1]_{\Theta} \).
(iv) Analogously as above, if \(a^b \in F\) then \((a, b) \in \Theta\) thus also \((a^z, b^z) \in \Theta\) for each \(z \leq a\), i.e. \(((a^z)^{b^z}, 1) = ((a^z)^{b^z}, (b^z)^{b^z}) \in \Theta\) thus \((a^z)^{(b^z)} \in F\).

We have shown that \([1]_\Theta\) is a filter of \(\mathcal{S}\).

Conversely, let \(F\) be a filter of \(\mathcal{S}\). We are going to prove that \(\Theta_F\) is a congruence on \(\mathcal{S}\) whose kernel is \(F\). Since \(1 \in F\), \(\Theta_F\) is reflexive and, by the definition, it is symmetrical. At first we observe that, by the definition of \(\Theta_F\),

\[ (\ast) \quad (x, y) \in \Theta_F \text{ if and only if } (x, x \lor y), (y, x \lor y) \in \Theta_F. \]

Now, we prove transitivity of \(\Theta_F\).

Assume \(\langle a, b \rangle, \langle b, c \rangle \in \Theta_F\). By (\ast) we have \(\langle a, a \lor b \rangle, \langle b, a \lor b \rangle, \langle b, b \lor c \rangle, \langle c, b \lor c \rangle \in \Theta_F\). Since \(b \leq a \lor b \) and \(b \leq b \lor c\), we apply (d) of Lemma 1 to get \(\langle a \lor b, a \lor b \lor c \rangle \in \Theta_F\) and \(\langle b \lor c, a \lor b \lor c \rangle \in \Theta_F\). Applying (b) of Lemma 1 we infer \(\langle a, a \lor b \lor c \rangle \in \Theta_F\) and \(\langle c, a \lor b \lor c \rangle \in \Theta_F\). By the definition of \(\Theta_F\) we obtain \(\langle a \lor b \lor c \rangle^a \in F\) and \(\langle a \lor b \lor c \rangle^c \in F\). Since \(\langle a \lor b \lor c \rangle^a \leq (a \lor c)^a\) and \(\langle a \lor b \lor c \rangle^c \leq (a \lor c)^c\), we infer by (i) that also \((a \lor c)^a, (a \lor c)^c \in F\) thus \(\langle a, c \rangle \in \Theta_F\).

We prove the substitution property of \(\Theta_F\).

Assume \(\langle x, y \rangle \in \Theta_F\) and \(\langle z, v \rangle \in \Theta_F\). Then \((x \lor y)^x, (x \lor y)^y \in F\) and, by (iii) also

\[ ((x \lor z) \lor (y \lor z))^{(x \lor z)} = (x \lor y \lor z)^{x \lor z} \in F \]

and

\[ ((x \lor z) \lor (y \lor z))^{(y \lor z)} = (x \lor y \lor z)^{y \lor z} \in F \]

thus \(\langle x \lor z, y \lor z \rangle \in \Theta_F\). Analogously we prove \(\langle y \lor z, y \lor v \rangle \in \Theta_F\) and, due to transitivity of \(\Theta_F\), we conclude \(\langle x \lor z, y \lor v \rangle \in \Theta_F\).

Assume \(\langle x, y \rangle \in \Theta_F\) and \(z \leq x, y\). As mentioned above, then \(\langle x, x \lor y \rangle \in \Theta_F\) and \(\langle y, x \lor y \rangle \in \Theta_F\) thus, by (c) of Lemma 1, also \(\langle x^z, (x \lor y)^z \rangle \in \Theta_F\) and \(\langle y^z, (x \lor y)^z \rangle \in \Theta_F\). Using symmetry and transitivity, we obtain \(\langle x^z, y^z \rangle \in \Theta_F\).

Finally, if \(a \in F\) then \((a \lor 1)^a = 1^a = a \in F\) and \((a \lor 1)^1 = 1^1 = 1 \in F\) thus \(\langle a, 1 \rangle \in \Theta_F\), i.e. \(a \in [1]_{\Theta_F}\). If \(a \in [1]_{\Theta_F}\) then \(\langle a, 1 \rangle \in \Theta_F\) and hence \(a = 1^a = (1 \lor a)^a \in F\). We conclude \(F = [1]_{\Theta_F}\). ■
Recall several concepts from [4]. An algebra $A$ with a constant 1 is called 
congruence distributive at 1 if

$$[1]_{\Theta \wedge (\Phi \vee \Psi)} = [1]_{(\Theta \wedge \Phi) \vee (\Theta \wedge \Psi)}$$

for all $\Theta, \Phi, \Psi \in \text{Con}A$. Further, $A$ is permutable at 1 if

$$[1]_{\Theta \cdot \Phi} = [1]_{\Phi \cdot \Theta}$$

for all $\Theta, \Phi \in \text{Con}A$. It is worth noticing that $\Theta \cdot \Phi$ and $\Phi \cdot \Theta$ need not be 
congruences of $A$; they are congruences if and only if they permute, i.e. if

$\Theta \cdot \Phi = \Phi \cdot \Theta$.

$A$ is called arithmetical at 1 if it is both congruence permutable at 1
and congruence distributive at 1. The following assertion follows directly
from Theorem 8.3.2 from [4].

**Proposition.** If $A$ is an algebra with a constant 1 and $A$ has a binary term
function $t(x, y)$ satisfying the identities $t(x, x) = 1 = t(1, x)$ and $t(x, 1) = x$ then $A$ is arithmetical at 1.

This yields immediately

**Corollary 1.** Every semilattice with SAI is arithmetical at 1.

**Proof.** One can take $t(x, y) = (x \lor y)^x$. Then $t(x, x) = (x \lor x)^x = x^x = 1$, 
$t(1, x) = (1 \lor x)^1 = 1^1 = 1$ and $t(x, 1) = (x \lor 1)^x = 1^x = x$. \hfill \blacksquare

Since every congruence is uniquely determined by its kernel, Corollary 1
gets the following

**Corollary 2.** Every semilattice $S$ with SAI is congruence distributive, i.e.
$\text{Con}S$ is a distributive lattice.

**Proof.** By Corollary 1 we infer

$$[1]_{\Theta \wedge (\Phi \vee \Psi)} = [1]_{(\Theta \wedge \Phi) \vee (\Theta \wedge \Psi)}$$

for all $\Theta, \Phi, \Psi \in \text{Con}S$ and, by Theorem 1, it yields $\Theta \wedge (\Phi \vee \Psi) = (\Theta \wedge \Phi) \vee (\Theta \wedge \Psi)$. \hfill \blacksquare
Unfortunately, Corollary 1 does not imply congruence permutability of \( S \) due to the fact that \( \Theta \cdot \Phi \) need not be a congruence on \( S \). However, we can prove the following

**Theorem 3.** Every semilattice with SAI is congruence 3-permutable.

**Proof.** By Corollary 2, \( S = (S; \lor, 1, (\sim)_{a \in S}) \) is congruence permutable at \( 1 \) and, due to Lemma 8.1.1 [4], it gets \([1]_{\Theta \lor \Phi} = [1]_{\Theta \cdot \Phi}\) for each \( \Theta, \Phi \in \text{Con} S \).

Assume \( (x, y) \in \Theta \lor \Phi \). By Theorem 1, we have \((x \lor y)^y \in [1]_{\Theta \cdot \Phi}\) and \((x \lor y)^x \in [1]_{\Theta \cdot \Phi}\). Hence, there exist \( z, v \in S \) such that

\[
\langle (x \lor y)^y, z \rangle \in \Theta, \quad \langle z, 1 \rangle \in \Phi 
\]

\[
\langle (x \lor y)^x, v \rangle \in \Theta, \quad \langle v, 1 \rangle \in \Phi.
\]

Then

(i) \( \langle x, (v \lor x)^x \rangle = \langle (1 \lor x)^x, (v \lor x)^x \rangle \in \Phi \)

(ii) \( \langle (z \lor y)^y, y \rangle = \langle (z \lor y)^y, (1 \lor y)^y \rangle \in \Phi \)

and

\( \langle x \lor y, (z \lor y)^y \rangle = \langle ((x \lor y)^y \lor y)^y, (z \lor y)^y \rangle \in \Theta \)

\( \langle x \lor y, (v \lor x)^x \rangle = \langle ((x \lor y)^x \lor x)^x, (v \lor x)^x \rangle \in \Theta \)

thus also \( \langle (v \lor x)^x, (z \lor y)^y \rangle \in \Theta \). This together with (i) and (ii) yields \( (x, y) \in \Phi \cdot \Theta \cdot \Phi \). We have shown \( \Theta \lor \Phi \subseteq \Phi \cdot \Theta \cdot \Phi \). The converse inclusion is trivial thus \( \Theta \lor \Phi = \Phi \cdot \Theta \cdot \Phi \) and hence \( S \) is congruence 3-permutable.

If \( S \) has a least element, we can prove a stronger assertion.

**Theorem 4.** Let \( S = (S; \lor, 1, (\sim)_{a \in S}) \) be a semilattice with SAI having a least element \( 0 \). Then \( S \) is congruence permutable.
**Proof.** Let \( S \) have a least element \( 0 \). Since the mapping \( x \mapsto x^0 \) is an antitone involution in the whole semilattice \((S; \lor)\), it is plain to show that \( x \land y = (x^0 \lor y^0)^0 \) is infimum of \( x, y \) thus \((S; \lor, \land)\) is a lattice.

Hence, \( \land \) is a term operation of \( S \) and we can construct the following ternary term operation

\[
p(x, y, z) = ((x \lor y)^x \lor z)^x \land ((z \lor y)^y \lor x)^y.
\]

An easy calculation gets

\[
p(x, x, z) = ((x \lor x)^x \lor z)^x \land ((z \lor x)^x \lor x)^x
\]

\[
= 1^x \land (z \lor x)^{xx} = z \land (z \lor x) = z
\]

and, analogously,

\[
p(x, z, z) = ((x \lor z)^z \lor z)^z \land ((z \lor z)^z \lor x)^z
\]

\[
= (x \lor z)^{xz} \land 1^x = (x \lor z) \land x = x.
\]

Thus \( p(x, y, z) \) is a Maltsev term function on \( S \) and hence \( S \) is congruence permutable.
