### Abstract

Let  $H$  be a graph. A decomposition of  $H$  is a set of edge-disjoint subgraphs of  $H$  whose union is  $H$ . A Hamiltonian path (respectively, cycle) of  $H$  is a path (respectively, cycle) that contains every vertex of  $H$  exactly once. A  $k$ -star, denoted by  $S_k$ , is a star with  $k$  edges. In this paper, we give necessary and sufficient conditions for decomposing the complete graph into  $\alpha$  copies of Hamiltonian path (cycle) and  $\beta$  copies of  $S_3$ .

**Keywords:** decomposition, complete graph, Hamiltonian path, Hamiltonian cycle, star.

**2010 Mathematics Subject Classification:** 05C70, 05C38.

### 1. INTRODUCTION

For positive integers  $m$  and  $n$ ,  $K_n$  denotes the complete graph with  $n$  vertices, and  $K_{m,n}$  denotes the complete bipartite graph with parts of sizes  $m$  and  $n$ . Let  $k$  be a positive integer. A  $k$ -path, denoted by  $P_k$ , is a path on  $k$  vertices. A  $k$ -cycle, denoted by  $C_k$ , is a cycle of length  $k$ . A  $k$ -star, denoted by  $S_k$ , is a star

with  $k$  edges, i.e.,  $S_k = K_{1,k}$ . Let  $H$  be a graph. A *spanning subgraph* of  $H$  is a subgraph of  $H$  containing every vertex of  $H$ . A spanning path (respectively, cycle) of  $H$  is called a Hamiltonian path (respectively, cycle) of  $H$ . A *1-factor* of  $G$  is a spanning subgraph of  $G$  in which each vertex is incident with exactly one edge.

Let  $F$ ,  $G$ , and  $H$  be graphs. A *decomposition* of  $H$  is a set of edge-disjoint subgraphs of  $H$  whose union is  $H$ . If  $H$  can be decomposed into  $\alpha$  copies of  $F$  and  $\beta$  copies of  $G$  for nonnegative integers  $\alpha$  and  $\beta$ , then we say that  $H$  has an  $\{\alpha F, \beta G\}$ -decomposition. Furthermore, if  $\alpha \geq 1$  and  $\beta \geq 1$ , then we say that  $H$  has an  $(F, G)$ -decomposition or  $H$  is  $(F, G)$ -decomposable.

Study on the existence of an  $(F, G)$ -decomposition of a graph has attracted a fair share of interest. Abueida and Daven [3] investigated the problem of  $(K_k, S_k)$ -decomposition of the complete graph  $K_n$ . Abueida and Daven [4] investigated the problem of the  $(C_4, E_2)$ -decomposition of several graph products where  $E_2$  denotes two vertex disjoint edges. Abueida and O'Neil [8] studied the existence problem for  $(C_k, S_{k-1})$ -decomposition of the complete multigraph  $\lambda K_n$  for  $k \in \{3, 4, 5\}$ . Priyadharsini and Muthusamy [25, 26] investigated the existence of  $(G, H)$ -decompositions of  $\lambda K_n$  and  $\lambda K_{n,n}$  where  $G, H \in \{C_n, P_n, S_{n-1}\}$ . A *graph-pair*  $(G, H)$  of order  $m$  is a pair of non-isomorphic graphs  $G$  and  $H$  with  $V(G) = V(H)$  such that both  $G$  and  $H$  contain no isolated vertices and  $G \cup H$  is isomorphic to  $K_m$ . Abueida and Daven [2] and Abueida, Daven and Roblee [5] completely determined the values of  $n$  for which  $\lambda K_n$  admits a  $(G, H)$ -decomposition where  $(G, H)$  is a graph-pair of order 4 or 5. Abueida, Clark and Leach [1] and Abueida and Hampson [6] considered the existence of decompositions of  $K_n - F$  into the graph-pairs of order 4 and 5, respectively, where  $F$  is a Hamiltonian cycle, a 1-factor, or an almost 1-factor. Lee [18, 19], Lee and Lin [22], and Lin [23] established necessary and sufficient conditions for the existence of  $(C_k, S_k)$ -decompositions of the complete bipartite graph, the complete bipartite multigraph, the complete bipartite graph with a 1-factor removed, and the multicrown, respectively. Abueida and Lian [7] and Beggas *et al.* [10] investigated the problems of  $(C_k, S_k)$ -decompositions of the complete graph  $K_n$  and  $\lambda K_n$ , giving some necessary or sufficient conditions for such decompositions to exist. Lee and Chen [20] completely settled the existence problem of  $(P_{k+1}, S_k)$ -decompositions of the complete multigraph  $\lambda K_n$  and the balanced complete bipartite multigraph  $\lambda K_{n,n}$ .

Recently, the existence problem of an  $\{\alpha F, \beta G\}$ -decomposition of a graph where  $\alpha$  and  $\beta$  are essential is also studied. Shyu gave necessary and sufficient conditions for the decomposition of  $K_n$  into paths and stars (both with 3 edges) [27], paths and cycles (both with  $k$  edges where  $k = 3, 4$ ) [28, 29], and cycles and stars (both with 4 edges) [30]. He [31] also gave necessary and sufficient conditions for the decomposition of  $K_{m,n}$  into paths and stars both with 3 edges.

Jeevadoss and Muthusamy [14, 15] considered the  $\{\alpha P_{k+1}, \beta C_k\}$ -decomposability of  $K_{m,n}$ ,  $K_n$  and  $\lambda K_{m,n}$ , giving some necessary or sufficient conditions for such decompositions to exist. Jeevadoss and Muthusamy [16] gave necessary and sufficient conditions for the existence of  $\{\alpha P_5, \beta C_4\}$ -decomposition of tensor product and cartesian product of complete graphs. In [33], Tarsi gave necessary and sufficient conditions for the existence of  $\{\alpha F, \beta S_k\}$ -decomposition of  $\lambda K_n$ , where  $F$  is any subgraph of  $K_n$  and  $\alpha = 0$ . In this paper, we consider the existence of an  $\{\alpha F, \beta G\}$ -decomposition of the complete graph  $K_n$  with  $F \in \{P_n, C_n\}$  and  $G = S_3$ , giving necessary and sufficient conditions.

## 2. PRELIMINARIES

We first collect some needed terminology and notation. Let  $G$  be a graph. The *degree* of a vertex  $x$  of  $G$ , denoted by  $\deg_G x$ , is the number of edges incident with  $x$ . For  $k \geq 2$ , the vertex of degree  $k$  in  $S_k$  is the *center* of  $S_k$  and any vertex of degree 1 is a *pendent vertex* of  $S_k$ . Let  $v_1 v_2 \cdots v_k$  denote the  $k$ -path through vertices  $v_1, v_2, \dots, v_k$  in order. The vertices  $v_1$  and  $v_k$  are referred to as its *origin* and *terminus*, respectively. In addition,  $P_k(v_1, v_k)$  denotes a  $k$ -path with origin  $v_1$  and terminus  $v_k$ . We use  $(v_1, v_2, \dots, v_k)$  to denote the  $k$ -cycle through vertices  $v_1, v_2, \dots, v_k, v_1$  in order, and  $S(u; v_1, v_2, \dots, v_k)$  to denote a star with center  $u$  and pendent vertices  $v_1, v_2, \dots, v_k$ . For  $U, W \subseteq V(G)$  with  $U \cap W = \phi$ , we use  $G[U]$  and  $G[U, W]$  to denote the subgraph of  $G$  induced by  $U$ , and the maximal bipartite subgraph of  $G$  with bipartition  $(U, W)$ , respectively. When  $G_1, G_2, \dots, G_t$  are edge disjoint subgraphs of a graph, use  $G_1 \cup G_2 \cup \cdots \cup G_t$  to denote the graph with vertex set  $\bigcup_{i=1}^t V(G_i)$  and edge set  $\bigcup_{i=1}^t E(G_i)$ .

Before going into more details, we present some results which are useful for our discussions.

**Proposition 1** [11, 13]. *For an even integer  $n$  and  $V(K_n) = \{x_0, x_1, \dots, x_{n-1}\}$ , the complete graph  $K_n$  can be decomposed into  $n/2$  copies of  $P_n, P(1), P(2), \dots, P(n/2)$  with  $P(i+1) = x_i x_{i-1} x_{i+1} x_{i-2} \cdots x_{i+\frac{n}{2}-2} x_{i+\frac{n}{2}-1} x_{i+\frac{n}{2}-1} x_{i+\frac{n}{2}}$  for  $0 \leq i \leq \frac{n}{2} - 1$ , where the subscripts of  $x$ 's are taken modulo  $n$  in the set of numbers  $\{0, 1, 2, \dots, n-1\}$ .*

The following results are attributed to Walecki, see [9].

**Lemma 2.** *For an odd integer  $n$  and  $V(K_n) = \{x_0, x_1, \dots, x_{n-1}\}$ , the complete graph  $K_n$  can be decomposed into  $(n-1)/2$  copies of  $C_n, C(1), C(2), \dots, C((n-1)/2)$  with  $C(i) = (x_0, x_i, x_{i-1}, x_{i+1}, x_{i-2}, \dots, x_{i+(n-5)/2}, x_{i+(n+1)/2}, x_{i+(n-3)/2}, x_{i+(n-1)/2})$  for  $i = 1, 2, \dots, (n-1)/2$ , where the subscripts of  $x$ 's are taken modulo  $n-1$  in the set of numbers  $\{1, 2, \dots, n-1\}$ .*

**Lemma 3.** For an even integer  $n$  and  $V(K_n) = \{x_0, x_1, \dots, x_{n-1}\}$ , the complete graph  $K_n$  can be decomposed into  $n/2 - 1$  copies of  $C_n$ ,  $C(1), C(2), \dots, C(n/2 - 1)$ , and a 1-factor  $F$ , where  $E(F) = \{x_0x_{n-1}, x_1x_{n-2}, x_2x_{n-3}, \dots, x_{n/2-2}x_{n/2+1}, x_{n/2-1}x_{n/2}\}$  and  $C(i) = (x_0, x_i, x_{i-1}, x_{i+1}, x_{i-2}, \dots, x_{i+n/2+1}, x_{i+n/2-2}, x_{i+n/2}, x_{i+n/2-1})$  for  $i = 1, 2, \dots, n/2 - 1$ , where the subscripts of  $x$ 's are taken modulo  $n - 1$  in the set of numbers  $\{1, 2, \dots, n - 1\}$ .

### 3. DECOMPOSITION OF $K_n$ INTO $n$ -PATHS AND 3-STARS

In this section, we obtain necessary and sufficient conditions for decomposing  $K_n$  into  $\alpha$  copies of  $P_n$  and  $\beta$  copies of  $S_3$ .

**Lemma 4.** Let  $n$  be an odd integer and let  $\alpha$  be a nonnegative integer. If  $\binom{n}{2} - (n - 1)\alpha$  is a nonnegative integer and  $\binom{n}{2} - (n - 1)\alpha \equiv 0 \pmod{3}$ , then

$$\alpha \in \begin{cases} \{0, 1, \dots, (n - 1)/2\} & \text{if } n \equiv 1 \pmod{6}, \\ \{(n - 3)/2 - 3t \mid t = 0, 1, \dots, (n - 3)/6\} & \text{if } n \equiv 3 \pmod{6}, \\ \{(n - 3)/2 - 3t \mid t = 0, 1, \dots, (n - 5)/6\} & \text{if } n \equiv 5 \pmod{6}. \end{cases}$$

**Proof.** Since  $\binom{n}{2} - (n - 1)\alpha$  is a nonnegative integer and  $n$  is odd,  $\alpha \leq \lfloor \binom{n}{2} / (n - 1) \rfloor = (n - 1)/2$ . Let  $\alpha = (n - 1)/2 - (3t + j)$  where  $t$  is a nonnegative integer and  $j \in \{0, 1, 2\}$ . Since  $\binom{n}{2} - (n - 1)\alpha = n(n - 1)/2 - (n - 1)\alpha = (n - 2\alpha)(n - 1)/2 = (6t + 2j + 1)(n - 1)/2$ ,  $\binom{n}{2} - (n - 1)\alpha \equiv (2j + 1)(n - 1)/2 \pmod{3}$ . If  $n \equiv 1 \pmod{6}$ , then  $(2j + 1)(n - 1)/2 \equiv 0 \pmod{3}$  for any integer  $j$ . Hence  $\alpha \in \{0, 1, \dots, (n - 1)/2\}$  for  $n \equiv 1 \pmod{6}$ . When  $n \equiv 3 \pmod{6}$  or  $n \equiv 5 \pmod{6}$ , the condition  $(2j + 1)(n - 1)/2 \equiv 0 \pmod{3}$  holds if and only if  $j = 1$ . Thus  $\alpha = (n - 3)/2 - 3t$  for some integer  $t$  when  $n \equiv 3 \pmod{6}$  or  $n \equiv 5 \pmod{6}$ . Since  $\alpha$  is a nonnegative integer, we have  $t \leq (n - 3)/6$  for  $n \equiv 3 \pmod{6}$ , and  $t \leq (n - 5)/6$  for  $n \equiv 5 \pmod{6}$ . This completes the proof.  $\blacksquare$

**Lemma 5.** Let  $n$  be an even integer, and let  $\alpha$  be a nonnegative integer. If  $\binom{n}{2} - (n - 1)\alpha \equiv 0 \pmod{3}$ , then

$$\alpha \in \begin{cases} \{n/2 - 3t \mid t = 0, 1, \dots, n/6\} & \text{if } n \equiv 0 \pmod{6}, \\ \{n/2 - 3t \mid t = 0, 1, \dots, (n - 2)/6\} & \text{if } n \equiv 2 \pmod{6}, \\ \{0, 1, \dots, n/2\} & \text{if } n \equiv 4 \pmod{6}. \end{cases}$$

**Proof.** Since  $\binom{n}{2} - (n - 1)\alpha$  is a nonnegative integer and  $n$  is even,  $\alpha \leq \lfloor \binom{n}{2} / (n - 1) \rfloor = n/2$ . Let  $\alpha = n/2 - (3t + j)$  where  $t$  is a nonnegative integer and  $j \in \{0, 1, 2\}$ . Since  $\binom{n}{2} - (n - 1)\alpha = n(n - 1)/2 - (n - 1)\alpha = (n - 2\alpha)(n - 1)/2 = (3t + j)(n - 1)$ ,  $\binom{n}{2} - (n - 1)\alpha \equiv j(n - 1) \pmod{3}$ . If  $n \equiv 4 \pmod{6}$ , then  $j(n - 1) \equiv 0 \pmod{3}$  for any integer  $j$ . Hence  $\alpha \in \{0, 1, \dots, n/2\}$  for  $n \equiv 4 \pmod{6}$ . When  $n \equiv 0$

(mod 6) or  $n \equiv 2 \pmod{6}$ , the condition  $j(n-1) \equiv 0 \pmod{3}$  holds if and only if  $j = 0$ . Thus  $\alpha = n/2 - 3t$  for some integer  $t$  when  $n \equiv 0 \pmod{6}$  or  $n \equiv 2 \pmod{6}$ . Since  $\alpha$  is a nonnegative integer, we have  $t \leq n/6$  for  $n \equiv 0 \pmod{6}$ , and  $t \leq (n-2)/6$  for  $n \equiv 2 \pmod{6}$ . This completes the proof. ■

The following indecomposable case is trivial.

**Lemma 6.** *The complete graph  $K_4$  cannot be decomposed into*

- (1) *one copy of  $P_4$  and one copy of  $S_3$ , nor*
- (2) *two copies of  $S_3$ .*

In addition, we exclude the possibility  $n = 5$ .

**Lemma 7.** *The complete graph  $K_5$  cannot be decomposed into one copy of  $P_5$  and two copies of  $S_3$ .*

**Proof.** Suppose, on the contrary, that  $K_5$  can be decomposed into one copy of  $P_5$ , say  $P_5(x, y)$ , and two copies of  $S_3$ , say  $S$  and  $T$ . Note that the edge  $xy$  must be in either  $S$  or  $T$ . Without loss of generality, assume that  $xy$  is in  $S$ . Since the degree of every vertex of  $K_n - E(P_5(x, y) \cup S)$  is less than 3, we have a contradiction. ■

In the remainder of the paper, we assume that  $V(K_n) = \{x_0, x_1, \dots, x_{n-1}\}$ .

**Lemma 8.** *If  $n$  is an odd integer with  $n \geq 7$ , then the following hold:*

- (1) *The complete graph  $K_n$  can be decomposed into  $(n-1)/2$  copies of  $P_n$  and  $(n-1)/6$  copies of  $S_3$  when  $n \equiv 1 \pmod{6}$ .*
- (2) *The complete graph  $K_n$  can be decomposed into  $(n-3)/2$  copies of  $P_n$  and  $(n-1)/2$  copies of  $S_3$ .*
- (3) *The complete graph  $K_n$  can be decomposed into  $(n-5)/2$  copies of  $P_n$  and  $5(n-1)/6$  copies of  $S_3$  when  $n \equiv 1 \pmod{6}$ .*

**Proof.** By Lemma 2,  $K_n$  can be decomposed into  $(n-1)/2$  copies of  $C_n, C(1), C(2), \dots, C((n-1)/2)$  with  $C(i) = (x_0, x_i, x_{i-1}, x_{i+1}, x_{i-2}, \dots, x_{i+(n-5)/2}, x_{i+(n+1)/2}, x_{i+(n-3)/2}, x_{i+(n-1)/2})$  for  $i = 1, 2, \dots, (n-1)/2$ , where the subscripts of  $x$ 's are taken modulo  $n-1$  in the set of numbers  $\{1, 2, \dots, n-1\}$ .

(1) For  $i = 1, 2, \dots, (n-1)/2$ , let  $P(i) = C(i) - \{x_0x_i\}$ . Clearly,  $P(i)$  is an  $n$ -path. Let  $G$  be the subgraph of  $K_n$  which is induced by the set of edges  $x_0x_1, x_0x_2, \dots, x_0x_{(n-1)/2}$ . Obviously,  $G = S_{(n-1)/2}$ . Since  $n$  is odd and  $n-1 \equiv 0 \pmod{3}$ , the graph  $G$  can be decomposed into  $(n-1)/6$  copies of  $S_3$ . This settles (1).

(2) For  $n = 7$ , the complete graph  $K_7$  can be decomposed into 2 copies of  $P_7$  and 3 copies of  $S_3$  as follows:  $x_6x_2x_5x_3x_4x_0x_1$ ,  $x_6x_4x_5x_0x_3x_1x_2$ ,  $(x_1; x_4, x_5, x_6)$ ,  $(x_2; x_0, x_3, x_4)$ ,  $(x_6; x_0, x_3, x_5)$ .

Now we consider the case  $n \geq 9$ . For  $i \in \{1, 2, \dots, (n-1)/2\} - \{(n-7)/2, (n-3)/2\}$ , let  $P(i) = C(i) - \{x_0x_i\}$ . Note that  $x_{n-1}x_{n-7} \in E(C((n-7)/2))$  and  $P((n-3)/2) = C((n-3)/2) = (x_0, x_{(n-3)/2}, x_{(n-5)/2}, x_{(n-1)/2}, x_{(n-7)/2}, \dots, x_{n-4}, x_{n-1}, x_{n-3}, x_{n-2})$ . Let  $P((n-7)/2) = C((n-7)/2) - \{x_{n-1}x_{n-7}\}$  and  $C((n-3)/2) - \{x_0x_{(n-3)/2}, x_{(n-1)/2}x_{(n-7)/2}\} \cup \{x_0x_{(n-1)/2}\}$ . Hence  $P(i)$  is an  $n$ -path for  $i = 1, 2, \dots, (n-1)/2$ . Moreover,  $P((n-1)/2) = x_{(n-1)/2}x_{(n-3)/2}x_{(n+1)/2}x_{(n-5)/2} \cdots x_{n-3}x_1x_{n-2}x_{n-1}x_0$ . For  $i = 1, 2, \dots, (n-3)/2$ , let  $S(i) = (x_{(n-1)/2-i}; x_{(n-1)/2+i-1}, x_{(n-1)/2+i})$  and  $S = (x_{n-1}; x_{n-2}, x_0)$ . Obviously,  $S(i)$  and  $S$  are 2-stars, and  $P((n-1)/2)$  can be decomposed into  $S(1), S(2), \dots, S((n-3)/2)$  and  $S$ . Furthermore, let  $W(i) = S(i) \cup \{x_0x_i\}$  for  $i = 1, 2, \dots, (n-3)/2 - \{(n-7)/2\}$ , let  $W((n-7)/2) = S((n-7)/2) \cup \{x_{(n-1)/2}x_{(n-7)/2}\}$ , and let  $W((n-1)/2) = S \cup \{x_{n-1}x_{n-7}\}$ . Clearly,  $W(i)$  is a 3-star. This settles (2).

(3) We will remove one edge from  $C(i)$  to obtain an  $n$ -path for  $i \in \{1, 2, \dots, (n-5)/2\}$ , and use  $C((n-3)/2)$  and  $C((n-1)/2)$  together with the edges removed from  $C(i)$ 's to constitute  $5(n-1)/3$  copies of  $S_3$ .

Let  $S(i) = (x_{(n-1)/2+3i-3}; x_{(n-1)/2-3i+1}, x_{(n-1)/2-3i})$  for  $i = 1, 2, \dots, (n-1)/6$ ,  $S'(i) = (x_{(n-1)/2-3i-1}; x_{(n-1)/2+3i-2}, x_{(n-1)/2+3i-1})$  for  $i = 1, 2, \dots, (n-7)/6$ , and  $S'((n-1)/6) = (x_{n-2}; x_{n-3}, x_0)$ . Obviously,  $S(i)$  and  $S'(i)$  are 2-stars. Let  $J = \{j | 2 \leq j \leq (n-1)/2 \text{ and } j \equiv 0, 2 \pmod{3}\}$ . For  $j \in J$ , let

$$e_j'' = \begin{cases} x_{(n-1)/2-j}x_{(n-1)/2+j-2} & \text{if } j \equiv 0 \pmod{3}, \\ x_{(n-1)/2-j}x_{(n-1)/2+j-3} & \text{if } j \equiv 2 \pmod{3}, \end{cases}$$

where the subscripts of  $x$ 's are taken modulo  $n-1$  in the set of numbers  $\{1, 2, \dots, n-1\}$ . It is easy to see that  $\{S(i), S'(i) | i = 1, 2, \dots, (n-1)/6\} \cup \{e_j'' | j \in J\}$  is a decomposition of  $C((n-3)/2) - \{x_{(n-3)/2}x_0\}$ .

Note that  $C((n-1)/2) = (x_0, x_{(n-1)/2}, x_{(n-3)/2}, x_{(n+1)/2}, x_{(n-5)/2}, \dots, x_{n-3}, x_1, x_{n-2}, x_{n-1})$ . Let  $S''(j) = (x_{(n-1)/2-j}; x_{(n-1)/2+j-1}, x_{(n-1)/2+j})$  for  $j = 1, 2, \dots, (n-3)/2$  and  $S''((n-1)/2) = (x_{n-1}; x_{n-2}, x_0)$  where the subscripts of  $x$ 's are taken modulo  $n-1$  in the set of numbers  $\{1, 2, \dots, n-1\}$ . Obviously,  $S''(j)$  is a 2-star, and  $C((n-1)/2) - \{x_{(n-1)/2}x_0\}$  can be decomposed into  $S''(1), S''(2), \dots, S''((n-1)/2)$ .

For  $i = 2, 3, \dots, (n-1)/6$ , let  $e_i$  be an edge in  $C(i-1)$  incident with the center of  $S(i)$ . Then  $C(i-1) - \{e_i\}$  is an  $n$ -path and  $S(i) \cup \{e_i\}$  is a 3-star. For  $i = 1, 2, \dots, (n-1)/6$ , let  $e'_i$  be an edge in  $C((n-1)/6 + i - 1)$  incident with the center of  $S'(i)$ . Then  $C((n-1)/6 + i - 1) - \{e'_i\}$  is an  $n$ -path and  $S'(i) \cup \{e'_i\}$  is a 3-star. Let  $K = \{k | 4 \leq k \leq (n-5)/2 \text{ and } k \equiv 1 \pmod{3}\}$ . For  $k \in K$ , let  $e_k''$  be an edge in  $C((k-1)/3 + (n-1)/3 - 1)$  incident with the center of  $S''(k)$ .

Then  $C((k-1)/3 + (n-1)/3 - 1) - \{e_k''\}$  is an  $n$ -path and  $S''(i) \cup \{e_k''\}$  is a 3-star. For  $j \in J$ ,  $S''(j) \cup \{e_j''\}$  is a 3-star. Moreover,  $S(1) \cup \{x_{(n-1)/2}x_0\}$  and  $S''(1) \cup \{x_{(n-3)/2}x_0\}$  are also 3-stars. This completes the proof.  $\blacksquare$

**Lemma 9.** *If  $n$  is an even integer with  $n \geq 4$ , then the following hold:*

- (1) *The complete graph  $K_n$  can be decomposed into  $n/2$  copies of  $n$ -paths.*
- (2) *The complete graph  $K_n$  can be decomposed into  $n/2 - 1$  copies of  $P_n$  and  $(n-1)/3$  copies of  $S_3$  when  $n \equiv 4 \pmod{6}$  and  $n \geq 10$ .*
- (3) *The complete graph  $K_n$  can be decomposed into  $n/2 - 2$  copies of  $P_n$  and  $2(n-1)/3$  copies of  $S_3$  when  $n \equiv 4 \pmod{6}$  and  $n \geq 10$ .*

**Proof.** By Proposition 1, we have (1).

(2) For  $n = 10$ , the complete graph  $K_{10}$  can be decomposed into 4 copies of  $P_{10}$  and 3 copies of  $S_3$  as follows:  $x_8x_2x_7x_3x_6x_4x_5x_0x_1x_9$ ,  $x_1x_3x_8x_4x_7x_5x_6x_0x_2x_9$ ,  $x_0x_3x_2x_4x_1x_5x_8x_6x_7x_9$ ,  $x_0x_7x_8x_9x_4x_3x_5x_2x_6x_1$ ,  $(x_0; x_4, x_8, x_9)$ ,  $(x_1; x_2, x_7, x_8)$ ,  $(x_9; x_3, x_5, x_6)$ .

Now we consider the case  $n \geq 16$ . Let  $G = K_n[\{x_0, x_1, \dots, x_{n-2}\}]$ . Clearly  $G$  is isomorphic to  $K_{n-1}$ . By Lemma 2, the graph  $G$  can be decomposed into  $n/2 - 1$  copies of  $C_{n-1}$ ,  $C(1), C(2), \dots, C(n/2 - 1)$  with  $C(i) = (x_0, x_i, x_{i-1}, x_{i+1}, x_{i-2}, \dots, x_{i+n/2-3}, x_{i+n/2}, x_{i+n/2-2}, x_{i+n/2-1})$  for  $i = 1, 2, \dots, n/2 - 1$ , where the subscripts of  $x$ 's are taken modulo  $n - 2$  in the set of numbers  $\{1, 2, \dots, n - 2\}$ . Note that  $C(1)$  contains edges  $x_1x_{n-2}$  and  $x_{n/2}x_0$ ,  $C(2)$  contains edges  $x_2x_1$  and  $x_{n/2+1}x_0$ , and  $C(3)$  contains the edge  $x_4x_1$ . Let  $P(1) = C(1) \cup \{x_1x_{n-1}x_{n/2}\} - \{x_1x_{n-2}, x_{n/2}x_0\}$ ,  $P(2) = C(2) \cup \{x_2x_{n-1}x_{n/2+1}\} - \{x_2x_1, x_{n/2+1}x_0\}$ , and  $P(3) = C(3) \cup \{x_4x_{n-1}\} - \{x_1x_4\}$ . In addition, let  $P(i) = C(i) \cup \{x_{i+n/2-1}x_{n-1}\} - \{x_{i+n/2-1}x_0\}$  for  $i = 4, 5, \dots, n/2 - 1$ . Obviously,  $P(i)$  is an  $n$ -path for  $i = 1, 2, \dots, n/2 - 1$ . Let  $S(1) = (x_0; x_{n/2}, x_{n/2+1}, x_{n/2+3}, x_{n/2+4}, \dots, x_{n-2})$  and  $S(2) = (x_{n-1}; x_0, x_3, x_5, x_6, \dots, x_{n/2-2}, x_{n/2-1}, x_{n/2+2})$ . It is easy to see that  $K_n - E\left(\bigcup_{i=1}^{n/2-1} P(i)\right) = S(1) \cup S(2) \cup (x_1; x_2, x_4, x_{n-2})$ . Note that  $S(1)$  and  $S(2)$  are  $(n/2 - 2)$ -stars. Since  $n \equiv 4 \pmod{6}$ , each of  $S(1)$  and  $S(2)$  can be decomposed into  $(n-4)/6$  copies of  $S_3$ . This settles (2).

(3) By Lemma 3,  $K_n$  can be decomposed into  $n/2 - 1$  copies of  $C_n, C(1), C(2), \dots, C(n/2 - 1)$ , and a 1-factor  $F$ , where  $E(F) = \{x_0x_{n-1}, x_1x_{n-2}, x_2x_{n-3}, \dots, x_{n/2-2}x_{n/2+1}, x_{n/2-1}x_{n/2}\}$  and  $C(i) = (x_0, x_i, x_{i-1}, x_{i+1}, x_{i-2}, \dots, x_{i+n/2+1}, x_{i+n/2-2}, x_{i+n/2}, x_{i+n/2-1})$  for  $i = 1, 2, \dots, n/2 - 1$ , where the subscripts of  $x$ 's are taken modulo  $n - 1$  in the set of numbers  $\{1, 2, \dots, n - 1\}$ .

We obtain  $n/2 - 2$  copies of  $P_n$  by removing one edge from each of  $n$ -cycles  $C(1), C(2), \dots, C(n/2 - 2)$ . For  $i = 1, 2, \dots, n/2 - 3$ , let  $P(i) = C(i) - \{x_0x_i\}$ . In addition, let  $P(n/2 - 2) = C(n/2 - 2) - \{x_{n/2-3}x_{n/2-1}\}$ . Trivially,  $P(i)$  is an  $n$ -path for  $i = 1, 2, \dots, n/2 - 2$ .

In the following,  $2(n-1)/3$  copies of  $S_3$  are constructed. We first obtain  $n/2$  copies of  $S_3$  by using all of the edges of  $C(n/2-1)$  and  $n/2-1$  edges of  $F$  and the edge  $x_{n/2-3}x_{n/2-1}$  removed from  $C(n/2-2)$ . Note that  $C(n/2-1) = (x_0, x_{n/2-1}, x_{n/2-2}, x_{n/2}, x_{n/2-3}, \dots, x_1, x_{n-3}, x_{n-1}, x_{n-2})$ . For  $i = 1, 2, \dots, n/2-1$ , let  $S(i) = (x_{n/2-1+i}; x_{n/2-1-i}, x_{n/2-2-i})$  and  $S = (x_{n/2-1}; x_{n/2-2}, x_0)$ . Obviously,  $S(i)$  and  $S$  are 2-stars, and  $C(n/2-1)$  is decomposable into  $S(1), S(2), \dots, S(n/2-1)$  and  $S$ . Let  $W(i) = S(i) \cup \{x_{n/2-1+i}x_{n/2-i}\}$  for  $i = 1, 2, \dots, n/2-1$ , and let  $W(n/2) = S \cup \{x_{n/2-3}x_{n/2-1}\}$ . Clearly,  $W(i)$  is a 3-star.

Now we obtain  $(n-4)/6$  copies of  $S_3$  by using one edge of  $F$  and the edges removed from  $C(i)$ 's in constructing  $n$ -paths for  $i = 1, 2, \dots, n/2-3$ . Let  $G$  be the subgraph of  $K_n$  induced by the set of edges  $x_0x_1, x_0x_2, \dots, x_0x_{n/2-3}, x_0x_{n-1}$ . Obviously,  $G = S_{n/2-2}$ . Since  $n \equiv 4 \pmod{6}$ , the graph  $G$  can be decomposed into  $(n-4)/6$  copies of  $S_3$ . This settles (3) and completes the proof. ■

**Lemma 10.** *Let  $n$  and  $t$  be positive integers. If  $Q_1, Q_2, \dots, Q_t$  are edge-disjoint Hamiltonian paths of  $K_n$ , then  $\bigcup_{i=1}^t Q_i$  is  $S_t$ -decomposable.*

**Proof.** Since each  $Q_i$  is a Hamiltonian path of  $K_n$ , we have  $V(Q_i) = V(K_n)$ . For each  $Q_i$ , we orient the edges of  $Q_i$  from  $x_0$  along  $Q_i$  to the end (or ends) of the path, and use  $\vec{Q}_i$  to denote the digraph obtained from  $Q_i$  for such an orientation. Note that there is exactly one arc directed into  $x_j$  for each  $j \in \{1, 2, \dots, n-1\}$ . Let  $\vec{G} = \bigcup_{i=1}^t \vec{Q}_i$ . It is easy to check that  $\deg_{\vec{G}}^- x_j = t$  for  $j \neq 0$ . Thus there exists an  $S_t$ -decomposition of  $\bigcup_{i=1}^t Q_i$  such that  $x_j$  is a center of a  $t$ -star for  $j \neq 0$ . This completes the proof. ■

By Lemma 10, the union of  $3t$  edge-disjoint  $n$ -paths can be decomposed into  $n-1$  copies of  $S_{3t}$ , in turn, each  $S_{3t}$  can be decomposed into  $t$  copies of  $S_3$ . Hence we have the following result.

**Theorem 11.** *Let  $n, p$  and  $t$  be positive integers with  $p \geq 3t$ , and let  $q$  be a nonnegative integer. If  $K_n$  can be decomposed into  $p$  copies of  $P_n$  and  $q$  copies of  $S_3$ , then  $K_n$  can be decomposed into  $p-3t$  copies of  $P_n$  and  $q+(n-1)t$  copies of  $S_3$ .*

Obviously, if  $K_n$  can be decomposed into  $\alpha$  copies of  $n$ -paths and  $\beta$  copies of  $S_3$ , then  $\binom{n}{2} = (n-1)\alpha + 3\beta$ . Using Theorem 11 together with Lemmas 4 to 9, we have the main result of this section.

**Theorem 12.** *Let  $n$  be a positive integer with  $n \geq 4$ , and let  $\alpha$  and  $\beta$  be nonnegative integers. The complete graph  $K_n$  can be decomposed into  $\alpha$  copies of  $P_n$  and  $\beta$  copies of  $S_3$  if and only if  $\binom{n}{2} = (n-1)\alpha + 3\beta$  and  $(n, \alpha, \beta) \notin \{(4, 1, 1), (4, 0, 2), (5, 1, 2)\}$ .*

4. DECOMPOSITION OF  $K_n$  INTO  $n$ -CYCLES AND 3-STARS

In this section, we obtain necessary and sufficient conditions for decomposing  $K_n$  into  $\alpha$  copies of  $C_n$  and  $\beta$  copies of  $S_3$ . The first two lemmas in the following are from [17] and [32], respectively.

**Lemma 13.** *For an odd integer  $n$  and  $V(K_{n,n}) = \{x_0, \dots, x_{n-1}\} \cup \{y_0, \dots, y_{n-1}\}$ , the complete bipartite graph  $K_{n,n}$  can be decomposed into  $(n-1)/2$  copies of  $C_{2n}$ ,  $C(0)$ ,  $C(1)$ ,  $\dots$ ,  $C((n-3)/2)$ , and a 1-factor  $F$ , where  $E(F) = \{x_0y_{n-1}, x_1y_0, \dots, x_{n-1}y_{n-2}\}$  and  $C(i) = (y_{2i}, x_0, y_{2i+1}, x_1, \dots, y_{2i+(n-2)}, x_{n-2}, y_{2i+(n-1)}, x_{n-1})$  for  $i = 0, 1, \dots, (n-3)/2$ .*

**Lemma 14.** *For an even integer  $n$  and  $V(K_{n,n}) = \{x_0, \dots, x_{n-1}\} \cup \{y_0, \dots, y_{n-1}\}$ , the complete bipartite graph  $K_{n,n}$  can be decomposed into  $n/2$  copies of  $C_{2n}$ ,  $C(0)$ ,  $C(1)$ ,  $\dots$ ,  $C(n/2-1)$ , where  $C(i) = (y_{2i}, x_0, y_{2i+1}, x_1, \dots, y_{2i+(n-2)}, x_{n-2}, y_{2i+(n-1)}, x_{n-1})$  for  $i = 0, 1, \dots, n/2-1$ .*

**Lemma 15.** *Let  $n$  be an odd integer and let  $\alpha$  be a nonnegative integer. If  $\binom{n}{2} - n\alpha$  is a nonnegative integer and  $\binom{n}{2} - n\alpha \equiv 0 \pmod{3}$ , then*

$$\alpha \in \begin{cases} \{0, 1, \dots, (n-1)/2\} & \text{if } n \equiv 0 \pmod{3}, \\ \{(n-1)/2 - 3t \mid t = 0, 1, \dots, \lfloor (n-1)/6 \rfloor\} & \text{otherwise.} \end{cases}$$

**Proof.** Since  $\binom{n}{2} - n\alpha$  is a nonnegative integer and  $n$  is odd,  $\alpha \leq \lfloor \binom{n}{2}/n \rfloor = (n-1)/2$ . Let  $\alpha = (n-1)/2 - (3t+i)$ , where  $t$  is a nonnegative integer and  $i \in \{0, 1, 2\}$ . Since  $\binom{n}{2} - n\alpha = n(n-1)/2 - n\alpha = n(n-1-2\alpha)/2 = n(3t+i)$ ,  $\binom{n}{2} - n\alpha \equiv ni \pmod{3}$ . If  $n$  is a multiple of 3, then  $ni \equiv 0 \pmod{3}$  holds for any  $i \in \{0, 1, 2\}$ . Hence  $\alpha \in \{0, 1, \dots, (n-1)/2\}$  for  $n \equiv 0 \pmod{3}$ . Otherwise, the condition  $ni \equiv 0 \pmod{3}$  holds if and only if  $i = 0$ . This implies  $\alpha = (n-1)/2 - 3t$ . Moreover,  $t \leq \lfloor (n-1)/6 \rfloor$  since  $\alpha$  is a nonnegative integer. This completes the proof.  $\blacksquare$

**Lemma 16.** *Let  $n$  be an even integer and let  $\alpha$  be a nonnegative integer. If  $\binom{n}{2} - n\alpha$  is a nonnegative integer and  $\binom{n}{2} - n\alpha \equiv 0 \pmod{3}$ , then*

$$\alpha \in \begin{cases} \{0, 1, \dots, n/2-1\} & \text{if } n \equiv 0 \pmod{3}, \\ \{n/2 - 3t - 2 \mid t = 0, 1, \dots, \lfloor (n-4)/6 \rfloor\} & \text{otherwise.} \end{cases}$$

**Proof.** Since  $\binom{n}{2} - n\alpha$  is a nonnegative integer and  $n$  is even,  $\alpha \leq \lfloor \binom{n}{2}/n \rfloor = n/2-1$ . Let  $\alpha = n/2-1 - (3t+i)$ , where  $t$  is a nonnegative integer and  $i \in \{0, 1, 2\}$ . Since  $\binom{n}{2} - n\alpha = n(n-1-2\alpha)/2 = n(6t+2i+1)/2$ ,  $\binom{n}{2} - n\alpha \equiv n(2i+1)/2 \pmod{3}$ . If  $n \equiv 0 \pmod{3}$ , then  $n/2 \equiv 0 \pmod{3}$ , this implies that  $n(2i+1)/2 \equiv 0 \pmod{3}$  holds for any  $i \in \{0, 1, 2\}$ . Hence  $\alpha \in \{0, 1, \dots, n/2-1\}$  for  $n \equiv 0$

(mod 3). Otherwise, the condition  $n(2i+1)/2 \equiv 0 \pmod{3}$  holds if and only if  $i = 1$ . This implies  $\alpha = n/2 - 3t - 2$ . Moreover,  $t \leq \lfloor (n-4)/6 \rfloor$  since  $\alpha$  is a nonnegative integer. This completes the proof.  $\blacksquare$

Let  $m = (n-3)/2$  for odd  $n$  and  $m = (n-2)/2$  for even  $n$ . Let  $C(1), C(2), \dots, C(m)$  be edge-disjoint  $n$ -cycles in  $K_n$ , and let  $G = K_n - \bigcup_{i=1}^m E(C(i))$ . Since  $\deg_G x = n - 1 - 2m \leq 2$  for each vertex  $x$ ,  $G$  has no  $S_3$ -decomposition. Thus we have the following result.

**Lemma 17.** *Let  $n \equiv 0 \pmod{3}$ . The complete graph  $K_n$  cannot be decomposed into  $(n-3)/2$  copy of  $C_n$  and  $n/3$  copies of  $S_3$  for odd  $n$ , and cannot be decomposed into  $(n-2)/2$  copy of  $C_n$  and  $n/6$  copies of  $S_3$  for even  $n$ .*

**Lemma 18.** *If  $n$  is an odd integer with  $n \geq 5$ , then the following hold:*

- (1) *The complete graph  $K_n$  can be decomposed into  $(n-1)/2$  copies of  $C_n$ .*
- (2) *The complete graph  $K_n$  can be decomposed into  $(n-5)/2$  copies of  $C_n$  and  $2n/3$  copies of  $S_3$  when  $n \equiv 3 \pmod{6}$  and  $n \geq 9$ .*
- (3) *The complete graph  $K_n$  can be decomposed into  $(n-9)/2$  copies of  $C_n$  and  $4n/3$  copies of  $S_3$  when  $n \equiv 3 \pmod{6}$  and  $n \geq 9$ .*

**Proof.** By Lemma 2, the complete graph  $K_n$  can be decomposed into  $(n-1)/2$  copies of  $C_n$ ,  $C(1), C(2), \dots, C((n-1)/2)$  with  $C(i) = (x_0, x_i, x_{i-1}, x_{i+1}, \dots, x_{i+(n-5)/2}, x_{i+(n+1)/2}, x_{i+(n-3)/2}, x_{i+(n-1)/2})$  for  $i = 1, 2, \dots, (n-1)/2$ , where the subscripts of  $x$ 's are taken modulo  $n-1$  in the set of numbers  $\{1, 2, \dots, n-1\}$ . Hence we have (1).

(2) If there exist  $s$  and  $t$  ( $1 \leq s < t \leq (n-1)/2$ ) such that  $C(s) \cup C(t)$  can be decomposed into  $2n/3$  copies of  $S_3$ , then we have the result. Consider the case  $s = (n+3)/6$  and  $t = n/3$ . Note that  $C((n+3)/6) = (x_0, x_{(n+3)/6}, x_{(n-3)/6}, x_{(n+9)/6}, x_{(n-9)/6}, \dots, x_{n/3-1}, x_1, x_{n/3}, x_{n-1}, \dots, x_{2n/3-2}, x_{2n/3+1}, x_{2n/3-1}, x_{2n/3})$ . For  $i = 1, 2, \dots, n/3 - 1$ , let  $S_2(i) = (x_{n-i}, x_{n/3-1+i}, x_{n/3+i})$  and  $S_2(n/3) = (x_{2n/3}, x_{2n/3-1}, x_0)$ . For  $j = 1, 2, \dots, (n-3)/6$ , let  $P_2(j) = x_j x_{n/3+1-j}$ . For  $j = (n+3)/6, (n+9)/6, \dots, n/3 - 1$ , let  $P_2(j) = x_j x_{n/3-j}$ . In addition, let  $P_2(0) = x_0 x_{(n+3)/6}$ . Obviously,  $S_2(i)$  is a 2-star for  $i = 1, 2, \dots, n/3$ , and  $P_2(j)$  is a 2-path for  $j = 0, 1, \dots, n/3 - 1$ . One can see that  $C((n+3)/6)$  can be decomposed into  $S_2(1), S_2(2), \dots, S_2(n/3)$  and  $P_2(0), P_2(1), \dots, P_2(n/3 - 1)$ .

On the other hand,  $C(n/3) = (x_0, x_{n/3}, x_{n/3-1}, x_{n/3+1}, x_{n/3-2}, x_{n/3+2}, \dots, x_{2n/3-2}, x_1, x_{2n/3-1}, x_{n-1}, \dots, x_{(5n-15)/6}, x_{(5n+3)/6}, x_{(5n-9)/6}, x_{(5n-3)/6})$ . For  $j = 1, 2, \dots, n/3 - 1$ , let  $S'_2(j) = (x_j, x_{2n/3-1-j}, x_{2n/3-j})$ . For  $i = 1, 2, \dots, (n+3)/6$ , let  $P'_2(i) = x_{n-i} x_{2n/3-2+i}$ . For  $i = (n+9)/6, (n+12)/6, \dots, n/3$ , let  $P'_2(i) = x_{n-i} x_{2n/3-1+i}$ . In addition, let  $P'_2(0) = x_0 x_{n/3}$  and  $P''_2(0) = x_0 x_{(5n-3)/6}$ . Obviously,  $S'_2(j)$  is a 2-star for  $i = 1, 2, \dots, n/3 - 1$ , and  $P'_2(0)$  and  $P'_2(i)$  are 2-paths for  $i = 0, 1, \dots, n/3$ . One can see that  $C(n/3)$  can be decomposed into  $S'_2(1), S'_2(2), \dots, S'_2(n/3 - 1)$  and  $P'_2(0), P'_2(1), \dots, P'_2(n/3)$  as well as  $P''_2(0)$ .

For  $i = 1, 2, \dots, n/3$ , let  $S_3(i) = S_2(i) \cup P'_2(i)$ . For  $j = 1, 2, \dots, n/3 - 1$ , let  $S'_3(j) = S'_2(j) \cup P_2(j)$ . Clearly,  $S_3(i)$  and  $S'_3(j)$  are 3-stars. In addition,  $P_2(0) \cup P'_2(0) \cup P''_2(0)$  is also a 3-star. Hence  $C((n+3)/6) \cup C(n/3)$  can be decomposed into  $2n/3$  copies of  $S_3$ . This settles (2).

(3) According to the proof of (2), the result holds if there exist  $s'$  and  $t'$  ( $s', t' \notin \{(n+3)/6, n/3\}$ ) such that  $C(s') \cup C(t')$  can be decomposed into  $2n/3$  copies of  $S_3$ . Consider the case  $s' = (n+9)/6$  and  $t' = n/3 + 1$ . Note that  $C((n+9)/6) = (x_0, x_{(n+9)/6}, x_{(n+3)/6}, x_{(n+15)/6}, x_{(n-3)/6}, \dots, x_{n/3+1}, x_1, x_{n/3+2}, x_{n-1}, \dots, x_{2n/3-1}, x_{2n/3+2}, x_{2n/3}, x_{2n/3+1})$ . For  $i = 1, 2, \dots, n/3 - 1$ , let  $S_2(i) = (x_{n+1-i}, x_{n/3+i}, x_{n/3+1+i})$  with  $x_n = x_1$  and  $S_2(n/3) = (x_{2n/3+1}, x_{2n/3}, x_0)$ . For  $j = 2, 3, \dots, (n+3)/6$ , let  $P_2(j) = x_j x_{n/3+3-j}$ . For  $j = (n+9)/6, (n+15)/6, \dots, n/3$ , let  $P_2(j) = x_j x_{n/3+2-j}$ . In addition, let  $P_2(0) = x_0 x_{(n+9)/6}$ . Obviously,  $S_2(i)$  is a 2-star for  $i = 1, 2, \dots, n/3$ , and  $P_2(j)$  is a 2-path for  $j = 0, 2, 3, \dots, n/3$ . One can see that  $C((n+3)/6)$  can be decomposed into  $S_2(1), S_2(2), \dots, S_2(n/3)$  and  $P_2(0), P_2(2), P_2(3), \dots, P_2(n/3)$ .

On the other hand,  $C(n/3 + 1) = (x_0, x_{n/3+1}, x_{n/3}, x_{n/3+2}, x_{n/3-1}, \dots, x_{2n/3}, x_1, x_{2n/3+1}, x_{n-1}, x_{2n/3+2}, x_{n-2}, \dots, x_{(5n-9)/6}, x_{(5n+9)/6}, x_{(5n-3)/6}, x_{(5n+3)/6})$ . For  $j = 2, 3, \dots, n/3$ , let  $S'_2(j) = (x_j, x_{2n/3+1-j}, x_{2n/3+2-j})$ . For  $i = 1, 2, \dots, (n+3)/6$ , let  $P'_2(i) = x_{n+1-i} x_{2n/3-1+i}$ , and for  $i = (n+9)/6, (n+12)/6, \dots, n/3$ , let  $P'_2(i) = x_{n+1-i} x_{2n/3+i}$  with  $x_n = x_1$ . In addition, let  $P'_2(0) = x_0 x_{n/3+1}$  and  $P''_2(0) = x_0 x_{(5n+3)/6}$ . Obviously,  $S'_2(j)$  is a 2-star for  $i = 2, 3, \dots, n/3$ , and  $P'_2(0)$  and  $P'_2(i)$  are 2-paths for  $i = 0, 1, \dots, n/3$ . One can see that  $C(n/3 + 1)$  can be decomposed into  $S'_2(2), S'_2(3), \dots, S'_2(n/3)$  and  $P'_2(0), P'_2(1), \dots, P'_2(n/3)$  as well as  $P''_2(0)$ .

For  $i = 1, 2, \dots, n/3$ , let  $S_3(i) = S_2(i) \cup P'_2(i)$ . For  $j = 2, 3, \dots, n/3$ , let  $S'_3(j) = S'_2(j) \cup P_2(j)$ . Clearly,  $S_3(i)$  and  $S'_3(j)$  are 3-stars. In addition,  $P_2(0) \cup P'_2(0) \cup P''_2(0)$  is also a 3-star. Hence  $C((n+9)/6) \cup C(n/3 + 1)$  can be decomposed into  $2n/3$  copies of  $S_3$ . This settles (3).  $\blacksquare$

For positive integers  $l$  and  $n$  with  $1 \leq l \leq n$ , the  $(n, l)$ -crown  $C_{n,l}$  is the bipartite graph with bipartition  $(X, Y)$ , where  $X = \{x_0, x_1, \dots, x_{n-1}\}$  and  $B = \{y_0, y_1, \dots, y_{n-1}\}$ , and edge set  $\{x_i y_j : i = 0, 1, \dots, n-1, j \equiv i+1, i+2, \dots, i+l \pmod{l}\}$ .

**Proposition 19** [24].  $\lambda C_{n,l}$  is  $S_k$ -decomposable if and only if  $k \leq l$  and  $\lambda n l \equiv 0 \pmod{k}$ .

**Lemma 20.** If  $n$  is an even integer  $n \geq 6$ , then the following hold:

- (1) The complete graph  $K_n$  can be decomposed into  $n/2 - 2$  copies of  $C_n$  and  $n/2$  copies of  $S_3$ .
- (2) The complete graph  $K_n$  can be decomposed into  $n/2 - 3$  copies of  $C_n$  and  $5n/6$  copies of  $S_3$  when  $n \equiv 0 \pmod{6}$ .

- (3) *The complete graph  $K_n$  can be decomposed into  $n/2 - 4$  copies of  $C_n$  and  $7n/6$  copies of  $S_3$  when  $n \equiv 0 \pmod{6}$  and  $n \geq 12$ .*

**Proof.** Let  $V(K_n) = X \cup Y$ , where  $X = \{x_0, \dots, x_{n/2-1}\}$  and  $Y = \{y_0, \dots, y_{n/2-1}\}$ . Note that  $K_n = K_n[X] \cup K_n[Y] \cup K_n[X, Y]$  where  $K_n[X]$  and  $K_n[Y]$  are isomorphic to  $K_{n/2}$  and  $K_n[X, Y]$  is isomorphic to  $K_{n/2, n/2}$ . We distinguish two cases : Case 1.  $n \equiv 0 \pmod{4}$  and Case 2.  $n \equiv 2 \pmod{4}$ .

*Case 1.*  $n \equiv 0 \pmod{4}$ . By Lemma 14,  $K_n[X, Y]$  can be decomposed into  $n/4$  copies of  $C_n$ ,  $C(0), C(1), \dots, C(n/4 - 1)$ , where  $C(i) = (y_{2i}, x_0, y_{2i+1}, x_1, \dots, y_{2i+(n/2-2)}, x_{n/2-2}, y_{2i+(n/2-1)}, x_{n/2-1})$  for  $i = 0, 1, 2, \dots, n/4 - 1$ . By Proposition 1, we have the following results.  $K_n[X]$  can be decomposed into the following  $n/4$  copies of  $P_{n/2} : P_{n/2}(x_0, x_{n/4}), P_{n/2}(x_1, x_{1+n/4}), \dots, P_{n/2}(x_{n/4-1}, x_{n/2-1})$ , and  $K_n[Y]$  can be decomposed into the following  $n/4$  copies of  $P_{n/2} : P_{n/2}(y_0, y_{n/4}), P_{n/2}(y_1, y_{1+n/4}), \dots, P_{n/2}(y_{n/4-1}, y_{n/2-1})$ .

For  $i = 0, 1, \dots, n/4 - 1$ , let  $Q(i) = P_{n/2}(x_i, x_{i+n/4}) \cup P_{n/2}(y_i, y_{i+n/4}) \cup \{y_i x_i, y_{i+n/4} x_{i+n/4}\}$ . Clearly,  $Q(i)$  is an  $n$ -cycle, and  $y_i x_i, y_{i+n/4} x_{i+n/4} \in E(C(0))$  for  $i = 0, 1, \dots, n/4 - 1$ . For  $1 \leq t \leq n/4 - 1$ , let

$$R(t) = \left( \bigcup_{i=0}^t C(i) \right) - \{y_i x_i, y_{i+n/4} x_{i+n/4} \mid 0 \leq i \leq n/4 - 1\}.$$

It is easy to see that  $R(t)$  is isomorphic to the crown  $C_{n/2, 2t+1}$ . Therefore,  $K_n$  can be decomposed into  $n/2 - (t + 1)$  copies of  $C_n$ ,  $Q(0), Q(1), \dots, Q(n/4 - 1)$  and  $C(t + 1), C(t + 2), \dots, C(n/4 - 1)$ , and one copy of  $(n/2, 2t + 1)$ -crown  $R(t)$ . Note that  $2t + 1 \geq 3$  and  $|E(R(t))| = |E(C_{n/2, 2t+1})| = (2t + 1)n/2$ . If  $(2t + 1)n/2 \equiv 0 \pmod{3}$ , then  $R(t)$  can be decomposed into  $(2t + 1)n/6$  copies of  $S_3$  by Proposition 19. Hence for  $n \equiv 0 \pmod{4}$ , we have the following.

If  $t = 1$ , then  $(2t + 1)n/2 = 3n/2 \equiv 0 \pmod{3}$  for each  $n$ . Thus  $K_n$  can be decomposed into  $n/2 - 2$  copies of  $C_n$  and  $n/2$  copies of  $S_3$ .

If  $t = 2$ , then  $(2t + 1)n/2 = 5n/2 \equiv 0 \pmod{3}$  for  $n \equiv 0 \pmod{6}$ . Thus  $K_n$  can be decomposed into  $n/2 - 3$  copies of  $C_n$  and  $5n/6$  copies of  $S_3$ .

If  $t = 3$ , then  $(2t + 1)n/2 = 7n/2 \equiv 0 \pmod{3}$  for  $n \equiv 0 \pmod{6}$ . Thus  $K_n$  can be decomposed into  $n/2 - 4$  copies of  $C_n$  and  $7n/6$  copies of  $S_3$ . This settles Case 1.

*Case 2.*  $n \equiv 2 \pmod{4}$ . Since  $n \equiv 2 \pmod{4}$ ,  $n/2$  is odd. By Lemma 13,  $K_n[X, Y]$  can be decomposed into  $(n - 2)/4$  copies of  $C_n$ ,  $C(0), C(1), \dots, C((n - 6)/4)$ , and a 1-factor  $F$ , where  $E(F) = \{x_0 y_{n/2-1}, x_1 y_0, \dots, x_{n/2-1} y_{n/2-2}\}$  and  $C(i) = (y_{2i}, x_0, y_{2i+1}, x_1, \dots, y_{2i+(n/2-1)}, x_{n/2-1})$  for  $i = 0, 1, \dots, (n - 6)/4$ .

Now we consider  $K_n[X]$  and  $K_n[Y]$ . By Lemma 2, we have the following results.  $K_n[X]$  can be decomposed into  $(n - 2)/4$  copies of  $C_{n/2}$ ,  $W(1), W(2), \dots, W((n - 2)/4)$  with  $W(i) = (x_0, x_i, x_{i-1}, x_{i+1}, x_{i-2}, \dots, x_{i+(n-10)/4}, x_{i+(n+2)/4},$

$x_{i+(n-6)/4}, x_{i+(n-2)/4}$ , and  $K_n[Y]$  can be decomposed into  $(n-2)/4$  copies of  $C_{n/2}, W'(1), W'(2), \dots, W'((n-2)/4)$  with  $W'(i) = (y_0, y_i, y_{i-1}, y_{i+1}, y_{i-2}, \dots, y_{i+(n-10)/4}, y_{i+(n+2)/4}, y_{i+(n-6)/4}, y_{i+(n-2)/4})$  for  $i = 1, 2, \dots, (n-2)/4$ , where the subscripts of  $x$ 's and  $y$ 's are taken modulo  $(n-2)/2$  in the set of numbers  $\{1, 2, \dots, (n-2)/2\}$ . For  $i = 1, 2, \dots, (n-2)/4$ , let

$$e(i) = \begin{cases} x_0x_1 & \text{if } i = 1, \\ x_ix_{i-1} & \text{if } i \text{ is odd and } i \geq 3, \\ x_{i+(n-6)/4}x_{i+(n-2)/4} & \text{if } i \text{ is even,} \end{cases}$$

and let

$$e'(i) = \begin{cases} y_0y_1 & \text{if } i = 1, \\ y_iy_{i-1} & \text{if } i \text{ is odd and } i \geq 3, \\ y_{i+(n-6)/4}y_{i+(n-2)/4} & \text{if } i \text{ is even.} \end{cases}$$

Let  $P(i) = W(i) - \{e(i)\}$  and  $P'(i) = W'(i) - \{e'(i)\}$ . Trivially,  $P(i)$  and  $P'(i)$  are  $(n/2)$ -paths. Let  $M = \{e(i) | 1 \leq i \leq (n-2)/4\}$  and  $M' = \{e'(i) | 1 \leq i \leq (n-2)/4\}$ . If  $n \equiv 2 \pmod{8}$ , then  $(n-2)/4$  is even. Hence  $M = \{x_0x_1, x_2x_3, \dots, x_{(n-10)/4}x_{(n-6)/4}, x_{(n+2)/4}x_{(n+6)/4}, \dots, x_{n/2-2}x_{n/2-1}\}$  and  $M' = \{y_0y_1, y_2y_3, \dots, y_{(n-10)/4}y_{(n-6)/4}, y_{(n+2)/4}y_{(n+6)/4}, \dots, y_{n/2-2}y_{n/2-1}\}$ . If  $n \equiv 6 \pmod{8}$ , then  $(n-2)/4$  is odd. Hence  $M = \{x_0x_1, x_2x_3, \dots, x_{n/2-3}x_{n/2-2}\}$  and  $M' = \{y_0y_1, y_2y_3, \dots, y_{n/2-3}y_{n/2-2}\}$ . Let  $H$  be the subgraph of  $K_n[X]$  induced by  $M$ , and let  $H'$  be the subgraph of  $K_n[Y]$  induced by  $M'$ . Clearly,  $K_n[X]$  can be decomposed into  $H$  and  $(n-2)/4$  copies of  $P_{n/2}, P(1), P(2), \dots, P((n-2)/4)$ , and  $K_n[Y]$  can be decomposed into  $H'$  and  $(n-2)/4$  copies of  $P_{n/2}, P'(1), P'(2), \dots, P'((n-2)/4)$ .

Let  $Z = \{y_0x_0, y_1x_1\} \cup \{y_{i-1}x_{i-1}, y_ix_i | i \text{ is odd and } i \geq 3\} \cup \{y_{i+(n-6)/4}x_{i+(n-6)/4}, y_{i+(n-2)/4}x_{i+(n-2)/4} | i \text{ is even}\}$ . Obviously,  $Z \subseteq E(C(0))$ . For  $i = 1, 2, \dots, (n-2)/4$ , let  $K = \{y_{i+(n-6)/4}x_{i+(n-6)/4}, y_{i+(n-2)/4}x_{i+(n-2)/4}\}$  and

$$Q(i) = \begin{cases} P(1) \cup P'(1) \cup \{y_0x_0, y_1x_1\} & \text{if } i = 1, \\ P(i) \cup P'(i) \cup \{y_{i-1}x_{i-1}, y_ix_i\} & \text{if } i \text{ is odd and } i \geq 3, \\ P(i) \cup P'(i) \cup K & \text{if } i \text{ is even,} \end{cases}$$

and let  $Q((n+2)/4) = H \cup H' \cup C(0) - Z$ . One can see that each  $Q(i)$  is an  $n$ -cycle. Thus  $K_n[X] \cup K_n[Y] \cup C(0)$  can be decomposed into  $(n+2)/4$  copies of  $C_n$ . For  $1 \leq t \leq (n-6)/4$ , let

$$R(t) = \left( \bigcup_{i=1}^t C((n-6)/4 - i + 1) \right) \cup F.$$

It is easy to see that  $R(t)$  is isomorphic to the crown  $C_{n/2, 2t+1}$ . Hence  $K_n[X, Y]$  can be decomposed into  $n/2 - (t+1)$  copies of  $C_n, Q(1), Q(2), \dots, Q((n+2)/4)$

and  $C(1), C(2), \dots, C((n-6)/4-t)$ , and one copy of  $(n/2, 2t+1)$ -crown  $R(t)$ . Note that  $2t+1 \geq 3$  and  $|E(R(t))| = |E(C_{n/2, 2t+1})| = (2t+1)n/2$ . If  $(2t+1)n/2 \equiv 0 \pmod{3}$ , then  $R(t)$  can be decomposed into  $(2t+1)n/6$  copies of  $S_3$  by Proposition 19.

If  $t = 1$ , then  $(2t+1)n/2 = 3n/2 \equiv 0 \pmod{3}$  for each  $n$ . Thus  $K_n$  can be decomposed into  $n/2 - 2$  copies of  $C_n$  and  $n/2$  copies of  $S_3$ .

If  $t = 2$ , then  $(2t+1)n/2 = 5n/2 \equiv 0 \pmod{3}$  for  $n \equiv 0 \pmod{6}$ . Thus  $K_n$  can be decomposed into  $n/2 - 3$  copies of  $C_n$  and  $5n/6$  copies of  $S_3$ .

If  $t = 3$ , then  $(2t+1)n/2 = 7n/2 \equiv 0 \pmod{3}$  for  $n \equiv 0 \pmod{6}$ . Thus  $K_n$  can be decomposed into  $n/2 - 4$  copies of  $C_n$  and  $7n/6$  copies of  $S_3$ . This settles Case 2.  $\blacksquare$

Let  $x$  and  $y$  be distinct vertices of a multigraph  $G$ . We use  $e_G(x, y)$  to denote the number of edges joining  $x$  and  $y$ . A star decomposition of  $G$  is *center balanced* if every vertex of  $G$  is the center of the same number of members in the decomposition.

**Proposition 21** [21]. *Let  $G$  be an  $r$ -regular multigraph with  $r \geq 1$ . Then  $G$  has a center balanced  $S_t$ -decomposition if and only if  $r \equiv 0 \pmod{2t}$  and  $e_G(x, y) \leq r/t$  for all  $x, y \in V(G)$  with  $x \neq y$ .*

**Lemma 22.** *Let  $n$  and  $t$  be positive integers. If  $Q_1, Q_2, \dots, Q_t$  are edge-disjoint Hamiltonian cycles of  $K_n$ , then  $\bigcup_{i=1}^t Q_i$  is  $S_t$ -decomposable.*

**Proof.** Since each  $Q(i)$  is 2-regular and  $V(Q(i)) = V(Q(j))$  for  $i, j \in \{1, 2, \dots, t\}$ ,  $\bigcup_{i=1}^t Q_i$  is  $2t$ -regular. Since  $2t \equiv 0 \pmod{2t}$  and  $e_{\bigcup_{i=1}^t Q_i}(x, y) \leq 1 < (2t)/t$  for all  $x, y \in V(\bigcup_{i=1}^t Q_i)$  with  $x \neq y$ , the result follows from Proposition 21.  $\blacksquare$

By Lemma 22, the union of  $3t$  copies of edge-disjoint  $n$ -cycles can be decomposed into  $n$  copies of  $S_{3t}$ , in turn, each  $S_{3t}$  can be decomposed into  $t$  copies of  $S_3$ . Hence we have the following result.

**Theorem 23.** *Let  $n, p$  and  $t$  be positive integers with  $p \geq 3t$ , and let  $q$  be a nonnegative integer. If  $K_n$  can be decomposed into  $p$  copies of  $C_n$  and  $q$  copies of  $S_3$ , then  $K_n$  can be decomposed into  $p - 3t$  copies of  $C_n$  and  $q + nt$  copies of  $S_3$ .*

Obviously, if  $K_n$  can be decomposed into  $\alpha$  copies of  $C_n$  and  $\beta$  copies of  $S_3$ , then  $\binom{n}{2} = n\alpha + 3\beta$ . Using Theorem 23 together with Lemmas 15 to 20, we have the main result of this section.

**Theorem 24.** *Let  $n, \alpha$  and  $\beta$  be positive integers. The complete graph  $K_n$  can be decomposed into  $\alpha$  copies of  $C_n$  and  $\beta$  copies of  $S_3$  if and only if  $\binom{n}{2} = n\alpha + 3\beta$  and  $\alpha \neq (n-3)/2$  for  $n \equiv 3 \pmod{6}$  and  $\alpha \neq (n-2)/2$  for  $n \equiv 0 \pmod{6}$ .*
