Abstract

Let R be a commutative ring with non-zero identity and let $Z(R)$ be the set of all zero-divisors. The Cayley graph $\text{CAY}(R)$ of R is the simple undirected graph whose vertices are elements of R and two distinct vertices x and y are joined by an edge if and only if $x - y \in Z(R)$. In this paper, we determine all isomorphism classes of finite commutative rings with identity whose $\text{CAY}(R)$ has genus one.

Keywords: Cayley graph, local ring, zero-divisor, planar graph, genus.

2010 Mathematics Subject Classification: 05C99, 05C15, 13A99.
